## MO BACTER and BIO-LIME

### **two organic fertilisers for a beautiful lawn**

- Unique slow release fertilisers which feed your lawn for over three months
- Both act to destroy moss by secondary action
- Both remove the need for raking out dead material after use
- See overleaf for more information on how to have a beautiful lawn without the backache

# Bio-Lime

## ...for lawns with a low pH

As your lawn grows it takes up nutrients from the soil. A natural process which normally leads to a reduction in pH, i.e. the soil becomes more acid. At the same time rain, which usually contains acid (acid rain), falls on the lawn increasing its acidity and washes out the lime. As a lawn becomes more acidic it creates an unhealthy environment for grass. The soil locks up nutrients and tends to become stagnant and sour. No matter how much fertiliser and irrigation you apply, your lawn will not respond. Unfortunately this is just the right environment for moss to thrive. So it is no wonder that many of our lawns suffer from moss invasion. Bio-Lime is the ideal Spring or Autumn fertiliser for combating a low Ph. It sweetens the soil making it less acid and encourages healthy strong grass growth. Bio-Lime also contains healthy bacteria which eats thatch and dead moss eliminating the need to rake or scarify. Finally, it contains magnesium which creates a green healthy sward and helps maintain it throughout the winter months.

Bio-Lime comes in 20kg bags (granular form) which covers 200 sq.mtrs.

# MO Bacter

## ...for lawns with moss infestation

MO Bacter is an organic fertiliser which releases its nutrients evenly over a twelve week period. Its effective ingredients are nitrogen, phosphate and potash 5.5.20 plus a bacteria (bacillus sp) which is found naturally in the soil but when added to fertiliser it consumes dead material like thatch and moss making it unnecessary for raking or scarification after treatment. The high potash content in MO Bacter destroys moss through secondary action. The moss over-feeds on the potash which then destroys the whole plant over a three to four week period. Unlike other fertilisers MO Bacter will not stain paths, patios or stonework. Being organic it is not harmful to animals or children. MO Bacter is best used in the spring, or early summer, to eliminate moss and late summer or early autumn to stifle its winter development. MO Bacter is at its most effective when the ground temperature is 10°C or more.

MO Bacter comes in 20kg bags (granular form) which covers 200 sq. mtrs.
